1 Introduction

A fintech processes digital payments every day. Some transactions are automatically flagged and require manual review by the operations team before they can be completed.

The company wants to determine the operational capacity required for the next day. Using the historical transaction data, estimate the probability that a transaction requires manual review and answer the following question:

- How many transactions should the team be prepared to review tomorrow to cover 95% of possible cases?

The dataset is available [here](#) (click here).
